

Archive software for SAP® - Audit-proof, favourable and slim!

inPuncto®

With the SAP-certified archive you realise a module comprehensive archiving of your data and documents - How does the certified archive software for SAP work?

Since the **archive software biz²Archiver** is fully integrated into the SAP system, the user exclusively works with masks of the familiar GUI.

There are no media disruptions to other applications.

The only exception is the biz²Viewer that, however, can easily be learnt with the clear functions. The viewer can be started within the Internet Explorer or can be displayed within a separately started SAP GUI.

Further knowledge about additional programs outside SAP is not necessary. A document cannot be researched and displayed outside SAP - increasing the data security even more.

- 1 A user requests a document from the SAP server.
- 2 SAP server sends information to the GUI.
- 3 The SAP GUI orders the document from the **archive software biz²Archiver**.
- 4 Local PC receives a URL-address to the document...
- 5 ...and starts the viewer (e.g. biz²Viewer in the Internet Explorer) - that completes the communication with SAP.
- 6 The biz²Viewer that has been started in the Internet Explorer communicates with the archive server in order to request single pages or additional documents.

Your benefits regarding archive software biz²Archiver:

Faster

- The biz²Archiver is addressed via the SAP standard interface "SAP HTTP(S)" – meaning the transfer of documents is not carried out via SAP application server but directly between the querying client and the archive

Better

- The biz²Archiver fully uses the SAP logics, like for example user management and authorizations. Thus the filing and the archiving scenarios are defined via SAP
- By means of optional crypto technique even hard disks become worm-able media.

Cheaper

- The license policy of the biz²Archiver is independent of the number of users and documents – just a great price-performance ratio
- No double maintenance of user and authorizations
- No special requirements concerning the infrastructure
- Virtualizable.
