

Archive software for SAP® - *Audit-proof, favourable and slim!*

With the SAP-certified archive you realise a module comprehensive archiving of your data and documents - How does the **certified archive software for SAP** work?

Since the **archive software biz²ArchiveServer** is fully integrated into the SAP system, the user exclusively works with masks of the familiar GUI.

There are no media disruptions to other applications.

The only exception is the biz²Viewer that, however, can easily be learnt with the clear functions. The viewer can be started within the Internet Explorer or can be displayed within a separately started SAP GUI.

Further knowledge about additional programs outside SAP is not necessary. A document cannot be researched and displayed outside SAP - increasing the data security even more.

The data protection conformity of the archiving is also covered: With the additional module for Information Lifecycle Management (ILM), dependencies of personal data and documents can be mapped in the system and also deleted in the legally required periods.

- 1 A user requests a document from the SAP system.
- 2 The SAP system sends information to the GUI.
- 3 The SAP GUI orders the document from the archive software biz²ArchiveServer.
- 4 Local PC receives a URL-address to the document from the archive...
...and starts the viewer (e.g. biz²Viewer) – that completes the communication with SAP.
- 5 The user works with the simple comfort functions of the started biz²Viewer to view, print, optimize the display, etc.
- 6

inPuncto®

Your benefits regarding the archive software:

Faster

- The biz²ArchiveServer is addressed via the SAP standard interface "SAP HTTP(S)" – meaning the transfer of documents is not carried out via SAP application server but directly between the querying client and the archive. Your SAP System is relieved!

Better

- The inPuncto Archive biz²ArchiveServer fully uses the SAP logics, like for example user management and authorizations. The storage and the archiving scenarios are defined directly in the SAP system.
- biz²ArchiveServer is independent of the storage medium. Whether on local hard disk / RAID system, NAS via network shares, TrueWORM, software WORM or additional third party software - the user has the free choice.
- Due to the WEBDav-based interface and the ILM-enabled storage, data protection obligations are taken into account and implemented.
- Using optional encryption techniques (biz²CryptoServer), data can also be stored in an encrypted manner on hard disks.

Cheaper

- The license policy of the biz²ArchiveServer is independent of the number of users and documents – just a great price-performance ratio
- No double maintenance of user and authorizations
- No special requirements concerning the infrastructure
- Virtualizable.
